Programmable Multi-Transducer for Industry

for the measurement of electrical variables in heavy-current power system

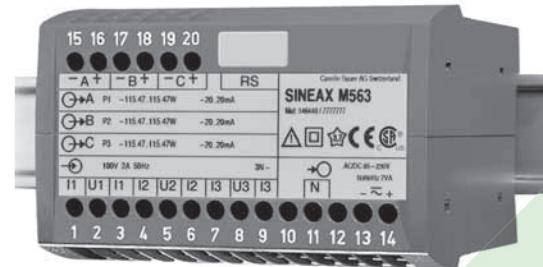

Fig. 1. SINEAX M 563 transducer in housing P20/105 clipped onto a top-hat rail.

Application

SINEAX M 561/M 562/M 563 (Fig.1) is a programmable transducer with a **RS 232 C interface**. M 561 supervises 1 variable (input) which is available on an analog output signal. Input and output are electrically isolated. M 562 resp. M 563 measure 2 resp. 3 variables simultaneously and generate **2** resp. **3** electrically isolated analog output signals.

The transducers are also equipped with an **RS 232** serial interface to which a PC with the corresponding software can be connected for programming or accessing and executing useful ancillary functions.

The usual methods of connection, the types of measured variables, their ratings, the transfer characteristic for each output etc. are the main parameters that can be programmed.

The ancillary functions include displaying, recording and evaluation of measurements on a PC, the simulation of the outputs for test purposes and a facility for printing nameplates.

The transducer fulfils all the essential requirements and regulations concerning electromagnetic compatibility (**EMC**) and **safety** (IEC 1010 resp. EN 61 010). It was developed and is manufactured and tested in strict accordance with the **quality assurance standard** ISO 9001.

Features / Benefits

- Simultaneous measurement of several variables of a heavy-current power system

Measured variables	Nominal input current	Nominal input voltage
Current, voltage (rms), active/reactive/apparent power $\cos\phi$, $\sin\phi$, power factor		
RMS value of the current with wire setting range (bimetal measuring function)	1 to 6 A	57.7 to 400 V (phase-to-neutral) resp. 100 to 693 V (phase-to-phase)
Slave pointer function for the measurement of the RMS value IB		
Frequency		
Average value of the currents with sign of the active power (power system only)		

- For all heavy-current power system variables
- Universal analog outputs (programmable)
- Input voltage up to 693 V (phase-to-phase)
- High accuracy: Class 0.2 (U, I) resp. 0.5 (all other quantities)
- Windows software with password protection for programming, data analysis, power system status simulation
- DC-, AC-power pack with wide power supply tolerance / Universal

Technical data

Measuring input →

Nominal input voltage:	57.7 to 400 V (phase-to-neutral) resp. 100 to 693 V (phase-to-phase)
Nominal input current:	1 to 6 A
Admissible measuring range end values:	See page 4 under "System response", column "Condition", and pages 9 and 10 under "Description 13 and 14"
Waveform:	Sinusoidal
Rated frequency:	50 or 60 Hz
Consumption [VA]:	Voltage circuit: $U^2 / 400 \text{ k}\Omega$ with external power supply Current circuit: $\leq I^2 \cdot 0.01 \Omega$

Analog outputs ↗

For the outputs A, B and C:

Output variable Y	Impressed DC current	Impressed DC voltage
Full scale Y2	$1 \leq Y2 \leq 20 \text{ mA}$	$5 \leq Y2 \leq 10 \text{ V}$
Limits of output signal for input overload and/or $R = 0$	$1.2 \cdot Y2$	40 mA
$R \rightarrow \infty$	30 V	1.2 Y2
Rated useful range of output load	$0 \leq \frac{7.5 \text{ V}}{Y2} \leq \frac{15 \text{ V}}{Y2}$	$\frac{Y2}{2 \text{ mA}} \leq \frac{Y2}{1 \text{ mA}} \leq \infty$
AC component of output signal (peak-to-peak)	$\leq 0.02 Y2$	$\leq 0.02 Y2$

The outputs A, B and C may be either short or open-circuited. They are electrically insulated from each other and from all other circuits (floating).

All the full-scale output values can be reduced subsequently using the programming software, but a supplementary error results.
